# **1. Editorial**

---

In this issue, we present the total numbers of rabies cases for the year 2010 as well as the details for the last quarter of 2010. Furthermore, we present numbers of animals tested for rabies.

A map showing the area covered by ORV campaigns in Europe in 2010 is included. Compared to the previous year, The Czech Republic stopped ORV and the Slovak Republic reduced the area, while Serbia and Kosovo started with ORV campaigns. In the next years other countries of the Western Balkan will also start with ORV in the frame of EU funded projects.

In this issue we provide a miscellaneous article by the Polish colleagues on the upsurge of rabies in the Małopolskie voivodship.

The second article is a summary of the Third European workshop for rabies provided by the EU-RL at ANSES, Nancy. As a new tool for the NRLs network the EU-RL website (<http://www.ansepro.fr/eurl-rabies/index.htm>) was introduced.

Conrad Freuling

### 3. Miscellaneous Articles

#### 3. 1 Rabies outbreak in Małopolskie voivodship in Poland

Marcin Smreczak<sup>1</sup>, Paweł Trębas<sup>1</sup>, Anna Orłowska<sup>1</sup>, Jolanta Staniak<sup>2</sup>, Krzysztof Ankiewicz<sup>3</sup>, Jan F. Żmudzinski<sup>1</sup>

<sup>1</sup>Virology Department, National Veterinary Research Institute, Pulawy, Poland

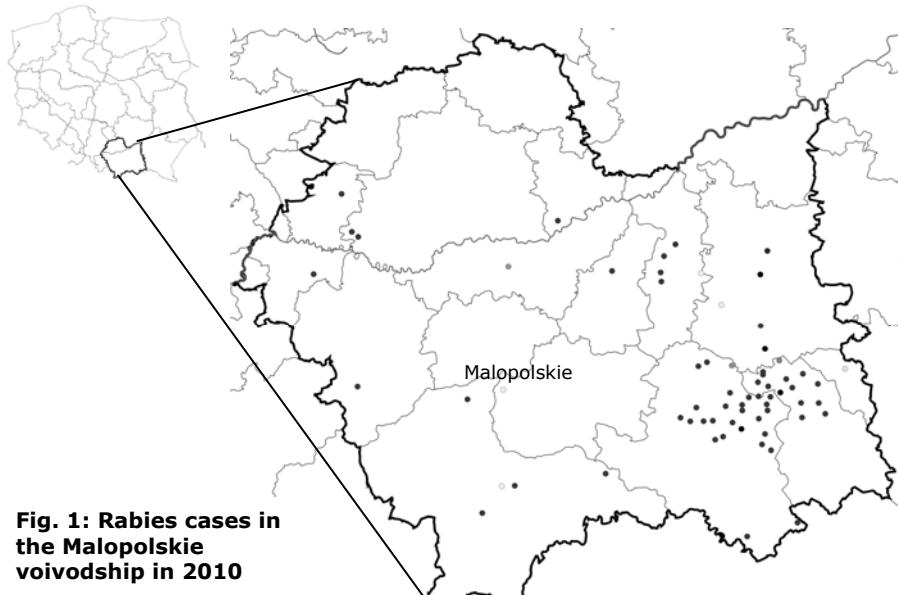

<sup>2</sup>Regional Veterinary Laboratory, ul. Brodowicza 13B, Krakow, Poland

<sup>3</sup>Veterinary Inspection, ul. Brodowicza 13A, Krakow, Poland

On August 12<sup>th</sup> 2010 a rabid fox attacked and bit a dog on a small farm in the municipality of Bobowa in the southeast of Poland (district Gorlice, voivodship Małopolskie, longitude: E 20°56'53"; latitude: N 49°42'51"; Fig 1). The fox was shot and sent to the regional veterinary laboratory in Krakow for rabies diagnosis. The examination of the brain sample by fluorescent antibody test (FAT) was positive for rabies. In order to confirm the preliminary diagnosis and to characterize the virus isolate, the brain of the rabid fox was sent to the National Reference Laboratory for Rabies located at the

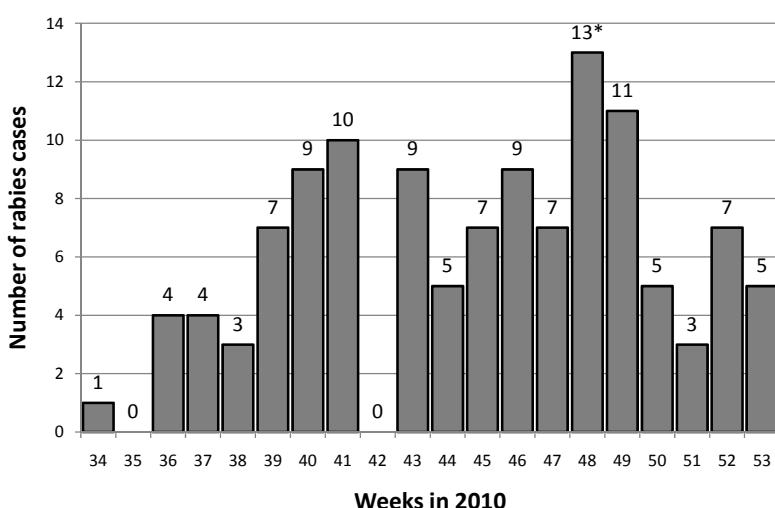

National Veterinary Research Institute in Pulawy. Rabies was confirmed by FAT and hn RT-PCR as well as by real-time RT-PCR. Additionally, differentiation of isolate was done by PCR-RFLP method. Test result showed clearly that the isolated rabies virus was a field virus.

The study confirmed the first positive rabies case in the area after seven years – the last positive case was diagnosed there in 2003. It should be also mentioned that since 1995 oral rabies vaccination (ORV) of foxes has been carried out in this area twice a year in spring and in autumn.

On 30<sup>th</sup> of August 2010, a dog suspected for rabies was submitted for rabies diagnosis to the regional veterinary diagnostic laboratory and also tested rabies positive. Three weeks before death the dog had been bitten by a laboratory confirmed rabid fox. This first case in a domestic animal occurred in the same municipality, Bobowa, in close proximity to the

first case. Unfortunately, in the following weeks and months further cases of rabies were diagnosed in this area. From the 12<sup>th</sup> of August 2010 till end of the year 118 rabies cases were identified (Fig. 2) in different species of animals. However, vast majority of cases were recorded in the red fox – 94 in total.

**Fig. 2: Dynamics of rabies epizootic in Małopolskie voivodship during 2010**

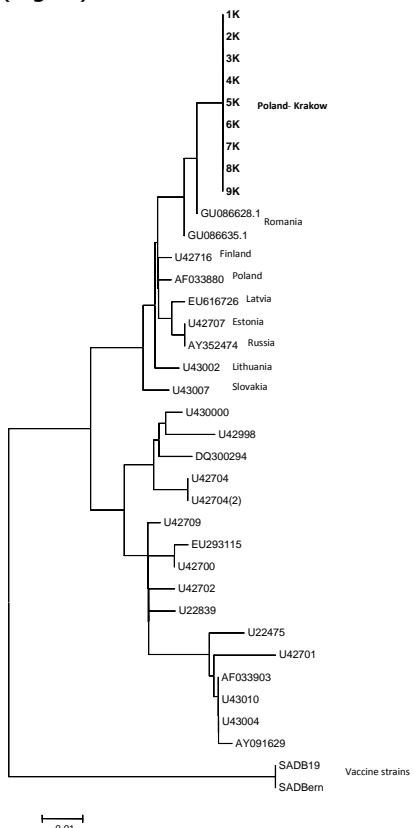

The outbreak involves 13 districts in the Małopolskie voivodship (Fig. 1) with the following number of animals affected: 94 foxes, 6 cats, 6 dogs, 4 cattle, 3 stone martens, 1 badger 2 sheep and 1 horse. Of the 13 districts where rabies has been occurred two of them recorded the highest number of rabies -77% (Tab. 1).

An intensive surveillance and monitoring program was initiated in order to investigate of source of infection in this area that had been rabies free for a long period. As we know the closest foci of rabies were located at

a distance of around 150 km to the East in the Podkarpackie voivodship in the border area with Ukraine. However, this appears too far for a rabid red fox to cover such large distance without leaving any traces of transmission of rabies virus to other animals.

We have also investigated the possible spill over the vaccine strain as a source of the current epidemic. However results of the study using RFLP method and phylogenetic analysis have confirmed that all isolates were classified as field strains of rabies virus (Fig.3). Also, one could speculate that a residual focus of rabies had

persisted in the area at a level below the detection threshold of the current rabies surveillance. However, epidemiological analysis confirmed that the level of surveillance in this province was adequate and therefore such scenario was considered unlikely a source of the current outbreak. Another possible and very probable source of infection could be illegal import of infected pet animals within the European Union or from the third countries. A preliminary phylogenetic analysis of isolates from the outbreak shows their high similarity with the strains circulating in Romania, Ukraine and Russia (Fig. 2).

**Fig. 3 Phylogenetic tree with isolates from the outbreak area using NJ method based on 560 bp fragment of the N-gene (Mega 4.1 software)**

However, additional studies need to be undertaken to confirm this hypothesis.

The results of a preliminary analysis show that the disease is mainly found among young foxes. It seems that a large proportion of young foxes is not enough protected against rabies after the spring ORV campaign. Heavy rains and floods following the vaccine distribution in spring 2010 may have contributed to the reduced availability of vaccine baits for animals and may have resulted in a poor performance of the ORV campaign.

Due to the situation in Małopolska different activities have been implemented to limit the spread of rabies from the outbreaks. First of all, it was decided to perform an additional vaccination campaign on the territory of the outbreak and 50 km around of the outbreak. This vaccination campaign was carried out in late November in order to stop the spread of disease among animals. The campaign was carried out on the area of 5,029 km<sup>2</sup> with 119,520 doses of vaccine distributed by plane. On the territory of 1,636 km<sup>2</sup> (most infected area) distances between flight lines were reduced from 1 km to 0.5 km.

It was also recommended to i) additionally vaccinate dogs and possibly cats, ii) to enhance surveillance by paying attention to all animals found dead especially wild and submit them for rabies test, and iii) to determine seroconversion and bait-uptake by also taking blood samples and the mandible bone, respectively, from foxes submitted to testing for rabies.

### **3. 2 Third European workshop for rabies and implementation of the EU-RL website**

E. Robardet and F. Cliquet

ANSES, Nancy laboratory for rabies and wildlife  
EU- and OIE Reference laboratory for rabies,  
Technopôle Agricole et Vétérinaire  
BP 40009, 54220 Malzéville, France

On September 22, 2010 the 3rd rabies workshop took place in Nancy (France) involving 38 National Reference Laboratories' (NRLs) participants from European Union (EU) Member States (MSs) countries. The main objective of the meeting focused on the rabies diagnosis techniques within MSs. The meeting started with a presentation of the results of the inter-laboratory trial 2010. A total of 24 European NRLs and 18 laboratories from third countries participated to the study. The three techniques concerned were Fluorescent Antibody Test (FAT), Rabies Tissue Culture Infection Test (RTCIT) and the Reverse Transcriptase Polymerase Chain Reaction (RT-PCR). Results revealed that the highest proportion of laboratories with concordant results was found in FAT (85.0%; n= 40 participants), RT-PCR (80.6%; n= 31 participants) followed by RT-CIT (77.3%; n= 22 participants).

The results more than satisfactory showed no error on samples issued from rabies virus (RABV), independently of the technique used. However, it was observed that efforts are still required in the detection of bat strains as false negatives still occurred on such strains (EBLV-1 and ABL-V : 2.5% in FAT, 13.6% in RTCIT, 0% in RT-PCR; EBLV-2: 2.5% in FAT, 4.5% in RTCIT, 0.03% in RT-PCR).

For each technique assessed (FAT, RTCIT, RT-PCR) a slight increase in the proportion of false positive

results was observed compared to the inter-laboratory results of 2009. This could be partly explained by the fact that tests of 2009 were performed by the help of two panels while the tests of 2010 were all perform on a single panel. The multiplicity of manipulations on a same panel could increase the probability of cross-contamination between samples leading to false positive results.

Finally it must be stressed that every laboratory failing in 2009 harbored concordant results in 2010 except one suggesting that participation in inter-laboratory tests can facilitate the laboratory improvement.

The second part of the meeting was focusing on discussion for harmonization of techniques in rabies diagnosis. For FAT and RTCIT, the variations in procedures within Member States were presented. The steps that should not be subject to variation in the procedures were discussed. Thus, for each step of the procedures (fixation, staining, etc...), recommendations have been proposed based on their importance (table 1 for FAT, table 2 for RTCIT). The session on RTCIT harmonization stressed the necessity to undertake successive passages on negative samples and discussion raised on the advantages of using successive dilutions of the inoculum.

Table1: Recommendation of the EU-RL for rabies diagnosis using FAT

<b>Procedure step</b>	<b>Strong recommendation</b>	<b>Recommendation</b>	<b>At laboratory decision</b>
1. Part of the brain	Brainstem and cerebellum or Ammon's horn (two replicates per sample)		
2. Preparation of slides	Impression/ smear method		
3. Drying before fixation		15-30 min at Room Temperature	
4. Fixation	Control and samples slides placed in separate rinse containers	Acetone; -20°C; 30min	
5. Drying before staining		15-30 min at RT	
6. Staining	Strictly follow manufacturers' recommendations		Addition of Evan's blue to conjugate
	37°C; 30 min; humid chamber		
7. Washing	Control and sample slides placed in separate rinse containers	Soaking 2 x 5min in PBS	
8. Mounting	Buffer mounting > or equal to pH 8.5 A strong concentration of glycerol may provide diminished staining		
9. Reading	Read slides within 2 hours	Final magnification from 200 to 400	
	2 independent trained readers		
10. Controls	Include positive and negative controls in each session		

A review of the RT-PCR techniques used in Members States was presented. General recommendations on the laboratory quality assurance, concerned facilities design (PCR laboratory should be divided into at least three physically separate rooms), unidirectional workflow (one way) to reduce the risk of contamination and staff that should be specifically trained and habilitated. Validation of PCR performances need to be

achieved in each NRL for robustness, repeatability, specificity and sensitivity (detection limit) using adequate controls. New perspectives in diagnosis offered by the real time PCR were also discussed. It should be noted that most recommendations were based on existing ones formulated by international organizations (EFSA: Cliquet et al., 2010; WHO: Meslin et al., 1996; OIE, 2008a) and scientific papers (Durham et al., 1986; Pital

and Janowitz, 1963 and Upcott and Markson, 1971; FAT; Rudd and Trimarchi, 1989; Webster, 1987:

RTCIT) and OIE (2008b) for quality standards on molecular biology techniques.

Table 2: Recommendations of the EU-RL for rabies diagnosis using RTCIT

<b>Procedure step</b>	<b>Strong recommendation</b>	<b>Recommendation</b>	<b>At laboratory decision</b>
1. Material	Microplate or Labtek		
2. Cell culture	Cell line: Neuroblastoma		E-MEM; Dulbecco's Modified Eagle Medium (D-MEM); Glasgow Minimum Essential Medium (G-MEM)
	Medium: Eagle's minimal essential medium (EMEM) without essential amino acids + 10% FBS + Antibiotics		
	Trypsination must be performed when cell monolayer at 80% confluence		
3. Inoculum preparation	Preparation at 10%		Frosting/ defrosting step
	Grinding medium: cell culture + antibiotic		
	Centrifugation at low temperature		
4. Inoculation (microplate)	Monolayer 80% confluence		Volume of medium and inoculum
4. Inoculation (Labtek)	Monolayer 80% confluence	50µl of inoculum and 400µl of medium per well ( $10^5$ cell /ml)	
5. Incubation	From 48h to 96h; 36°C ±2; 5% CO <sub>2</sub>		
	Change medium at 72h		
6. Washing	PBS	Soaking 2x	
7. Fixation	100% acetone (Labtek); 80% acetone (microplate)		
8. Drying		15-30 min at Room Temperature	
9. Staining	Follow strictly the manufacturer's recommendations		Use of Evan's blue
	37°C; 30min		
10. Washing	PBS	Soaking 2x for microplate, Soaking 2x 5min for Labtek	
11. Reading	2 independent trained readers	General magnification from 200 to 400	
12. Controls	Include positive and negative controls		

A new tool for the NRLs network has been presented: the EU-RL website (<http://www.ansespro.fr/eurl-rabies/index.htm>). The first website part is intended for a wide audience and provides information about the tasks and interests of the EU-RL in the fight against rabies, the European Commission implication in rabies field and the NRLs network. A second part is dedicated to information provided by the EU-RL for NRLs. Any new request for access should be asked previously to the EU-RL for rabies. This section presents the calendar and important events linked to the EU-RL in the "news, calendar" section. Following this section, the visitor can find then a more detailed presentation of the EU-RL group and presentations of the NRLs in "EU-RL/ NRLs presentation". In this framework each NRL is invited to provide information form on its laboratory and rabies activities. In the third section named "documentation" all documents produced by the EU-RL like workshop report and inter-laboratory reports are available. The fourth section is focused on the technical support offered by the EU-RL for laboratories including the list of trainings and reference reagents. A database on the sequences identified within member states will also be shortly accessible and should be regularly fulfilled. This database will record epidemiological information on the rabies strains from MSs and include the corresponding GenBank accession number of the sequences in order to avoid the duplication of information and not to impose a redundant work to the NRLs. Combination of the data will allow an optimal use of GenBank database which is an

adequate and useful tool for publication, research and analysis of sequences. The EU-RL hopes this tool will become a real exchange platform within MSs NRLs.
